## 1.Computer monitor settings

The auxiliary output teleprompter display can be configured by changing the Windows display properties. The most important property to change is the option to extend the computer desktop (Computer Extended Display).

### ①Windows 10 OS Desktop Settings

First, we open Windows settings and select the first system setting. In the system settings interface, we click the first item in the left directory column, that is, display settings. We swipe down in the display settings until we find the multi-monitor settings option, at this point the multi-monitor is set to duplicate these monitors, which means that the content displayed on multiple monitors is the same, we click on it to change. Set it to extend these monitors so that the computer can set up multiple monitors to extend the display.

### ②Windows 7 OS Desktop Settings

Click on the screen resolution, right-click on the computer desktop, and click on the screen resolution. Click Detect to enter the screen resolution, and click Detect at the top. Click on the display Click on the display to set the extended screen. Note: The resolution of the main monitor and the extended monitor must be the same.

\* Note: please set the main screen Scaling as 100%

**2.Using HEROVIEW teleprompter software for the first time**

①The rest of this section assumes that you are using your computer to create/edit/roll scripts that will appear on the monitor of the just-assembled Beginner Series Prompter.

②Download the HEROVIEW software to the desktop, find the HEROVIEW folder on the desktop, open the folder and find the shortcut to start HEROVIEW software.

Software

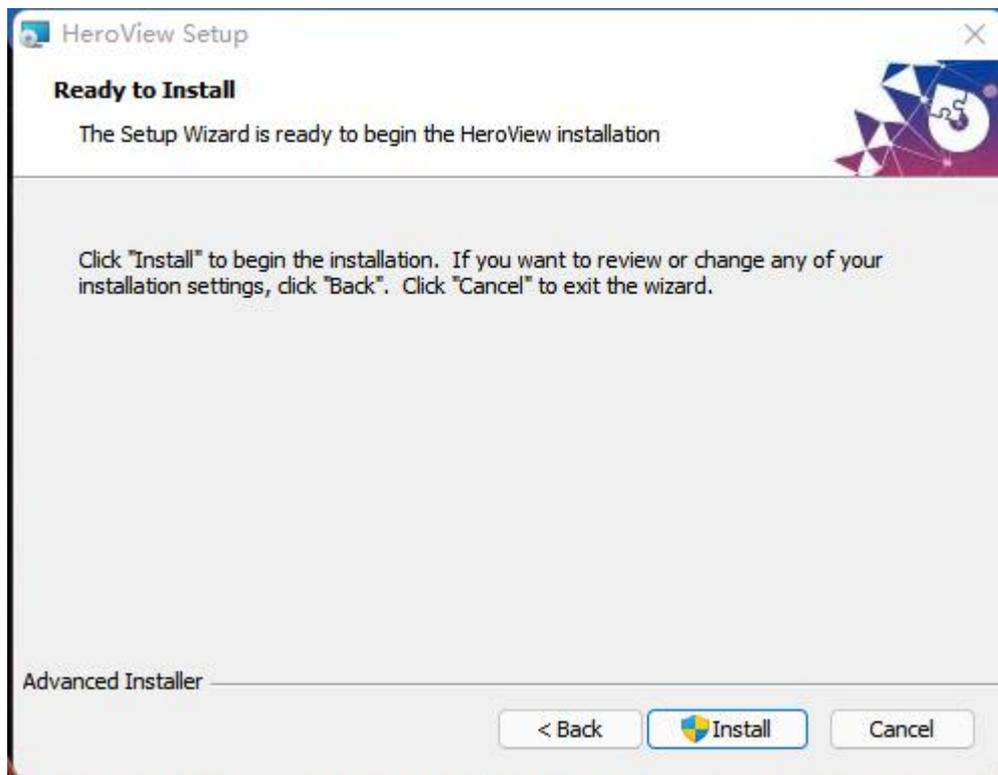

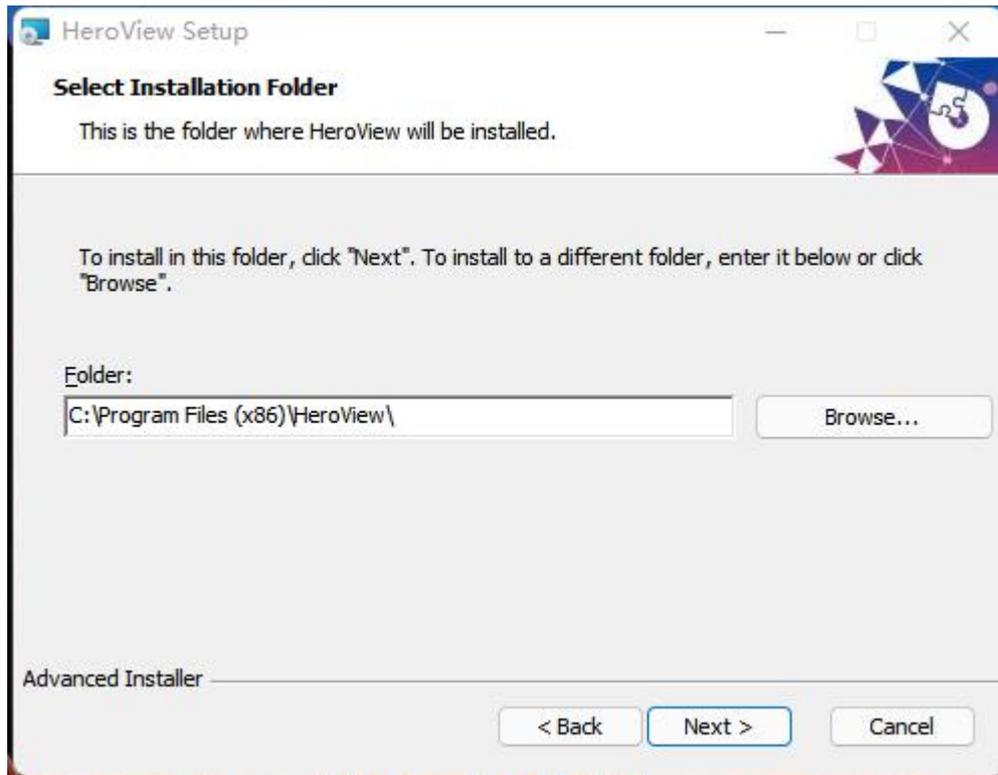

After installation

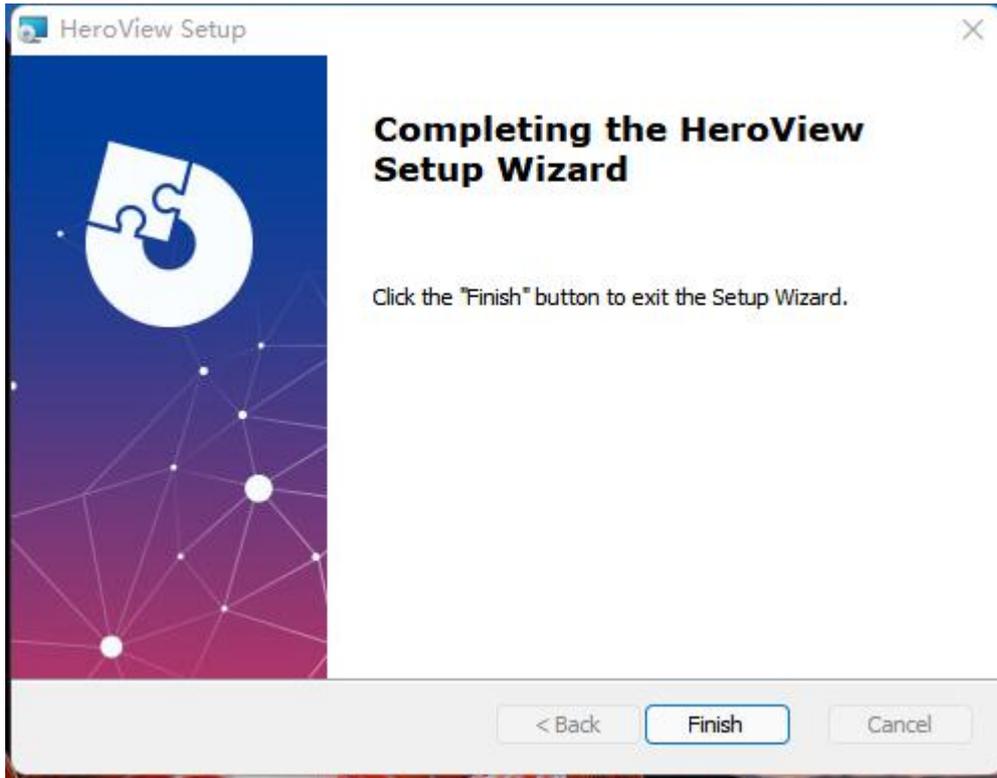

Download address : [www.heroview.cn](http://www.heroview.cn)

Teleprompter download for HEROVIEW BASIC
